Albert Nicholas Chandra

Cloud Engineering , Network Engineer , Back end developer , IT architect
albert.nicholaschandra@gmail.com 08112078781 Jakarta

Summary

Computer Science student (GPA 3.7/4.0) who builds software solo, end-to-end, from AI-powered apps to full-stack web products. Projects include a real-time sign-language platform, a skin-cancer detection model at 89.3% accuracy, and a spare-part inventory web app with barcode scanning, built for my family's business using React, TypeScript, and Supabase. Self-taught across Python, Go, TypeScript, and cloud tooling, with hands-on team experience from a NASA hackathon and two years mentoring peers. Eager to grow as a well-rounded, T-shaped developer.

Education

Computer Science — Jakarta Barat • 2022 – 2028
BINA NUSANTARA — Bachelor • 3.7
https://binus.ac.id/

Experience

Proyek Usaha Keluarga — Jakarta
Fullstack Developer — 2024 – Present

- Membangun aplikasi web inventaris dan penghitungan stok suku cadang untuk usaha keluarga yang melayani pelanggan, termasuk **TAP(Triputra Agro Persada)**
- Mengembangkan fitur scan barcode menggunakan kamera perangkat untuk mempercepat pencarian dan pendataan barang
- Membuat pencatatan transaksi stok (masuk, keluar, hitung ulang, dan penyesuaian) lengkap dengan riwayat audit
- Menerapkan akses berbasis peran (Admin dan Staf), laporan status stok, dan ekspor CSV
- Menyediakan mode demo offline yang menyimpan data di browser sebagai cadangan saat backend tidak tersedia
- Teknologi: TanStack Start, React 19, TypeScript, Tailwind CSS, shadcn/ui, Supabase

Projects

KitaBisa(Website for to learn sign language) — 2026
Isyaratku "KitaBisa" — AI Sign Language Learning Platform *(Team project, 2026 — sole developer)*

Collaborated with a design team to build a platform teaching sign language via real-time AI feedback; built the entire technical stack solo.

- Built an AI vision service (FastAPI + MediaPipe) for real-time gesture-accuracy scoring
- Developed the full backend (Django/FastAPI) for auth, progress tracking, and community features
- Implemented the frontend (Tailwind CSS) based on the team's design, including dashboards and quizzes
- Screenshot:Output

https://github.com/AlbertNC12/KitaBisa/

Weather APP— NASA Space Apps Challenge (Team project — backend)

- Built the backend for a weather prediction app using the NASA POWER API, handling data-range analysis, rainfall prediction logic, and JSON export
- Team collaborated on frontend (JavaScript, Leaflet.js) and deployment (Vercel)

https://nasa-space-app-challenge-2025-3uon-i3esy99ej.vercel.app/

Cancer Detection AI

- Developed a skin lesion classification model using **ResNet-50** with transfer learning and fine-tuning, achieving **89.3% accuracy**.
- Achieved **93.3% precision and 93.3% recall** through image preprocessing, data augmentation, and model optimization.
- Evaluated model performance using accuracy, precision, recall, and classification metrics to assess skin lesion classification effectiveness.

https://shorturl.at/IkdCw

formula 1 API

- Developed a RESTful API providing structured Formula 1 data, including historical standings, drivers, teams, race results, and championship statistics from 1950 to the present.
- Designed API endpoints using **FastAPI** and **Python**, with OpenAPI documentation for easy API exploration and integration.
- Implemented data processing and normalization to transform Formula 1 data from external sources into consistent JSON responses.
- Designed endpoints for querying driver and constructor performance by season, including championship standings and historical statistics.
- Applied backend development practices including API routing, data validation, error handling, and modular project structure.

https://github.com/AlbertNC12/F1API

Url Shortener

- Developed a RESTful URL Shortener API using **Go (Golang), Redis, and Docker**, with efficient URL generation, storage, and retrieval.
- Containerized the application with **Docker** and used **Redis** for fast in-memory data storage and caching.

https://github.com/AlbertNC12/urlshortener

Phishing Website Detection Using CNN–LSTM 2026

- Developed a deep learning model to detect phishing websites directly from **HTML content** using a hybrid **CNN–LSTM architecture**.
- Applied separate **word-level and character-level preprocessing/vectorization** to capture both semantic and structural patterns in HTML.
- Achieved **92.3% classification accuracy** in distinguishing phishing from legitimate websites.

https://shorturl.at/3P3ZI

Awards

NASA Space Apps Challenge 2022
Nasa

- Developed a responsive weather web application that provides real-time weather information based on user-selected locations.
- Integrated a weather API to retrieve and display current temperature, weather conditions, humidity, wind speed, and other forecast data.

Volunteer

Himti 2024 – 2025
Bina Nusantara

- Assisted fellow students in preparing for examinations by providing academic guidance, study materials, and exam preparation support.(As a MC)
- Helped students understand challenging course topics through discussions, explanations, and collaborative study sessions.

https://student-activity.binus.ac.id/himti/

Keluarga Mahasiswa Buddhis Dhammavaddhana (KMBD) 2024 – 2025
Bandung

1. Assisted in teaching students about Buddhist teachings, values, and practices.
2. Supported students in understanding Buddhist principles through discussions and learning activities.
3. Participated in organizing **Waisak Day** events, including preparation, coordination, and event activities.
